

# Study of the astrophysical $^{25}\text{Al}(p,\gamma)^{26}\text{Si}$ nuclear reaction

**H. MEBREK<sup>1</sup>, M. BOUHELAL<sup>2</sup> AND D. BAHLOUL<sup>3</sup>**

**<sup>1</sup>PRIMALAB LABORATORY, DEPARTMENT OF PHYSICS, UNIVERSITY OF BATNA 1, ALGERIA**

**<sup>2</sup>LABORATOIRE DE PHYSIQUE APPLIQUÉE ET THÉORIQUE, DEPARTMENT OF MATERIAL SCIENCES, LARBI TEBESSI UNIVERSITY, ALGERIA**

**<sup>3</sup>HIGHER NATIONAL SCHOOL OF RENEWABLE ENERGY, ENVIRONMENT AND SUSTAINABLE DEVELOPMENT, ALGERIA**

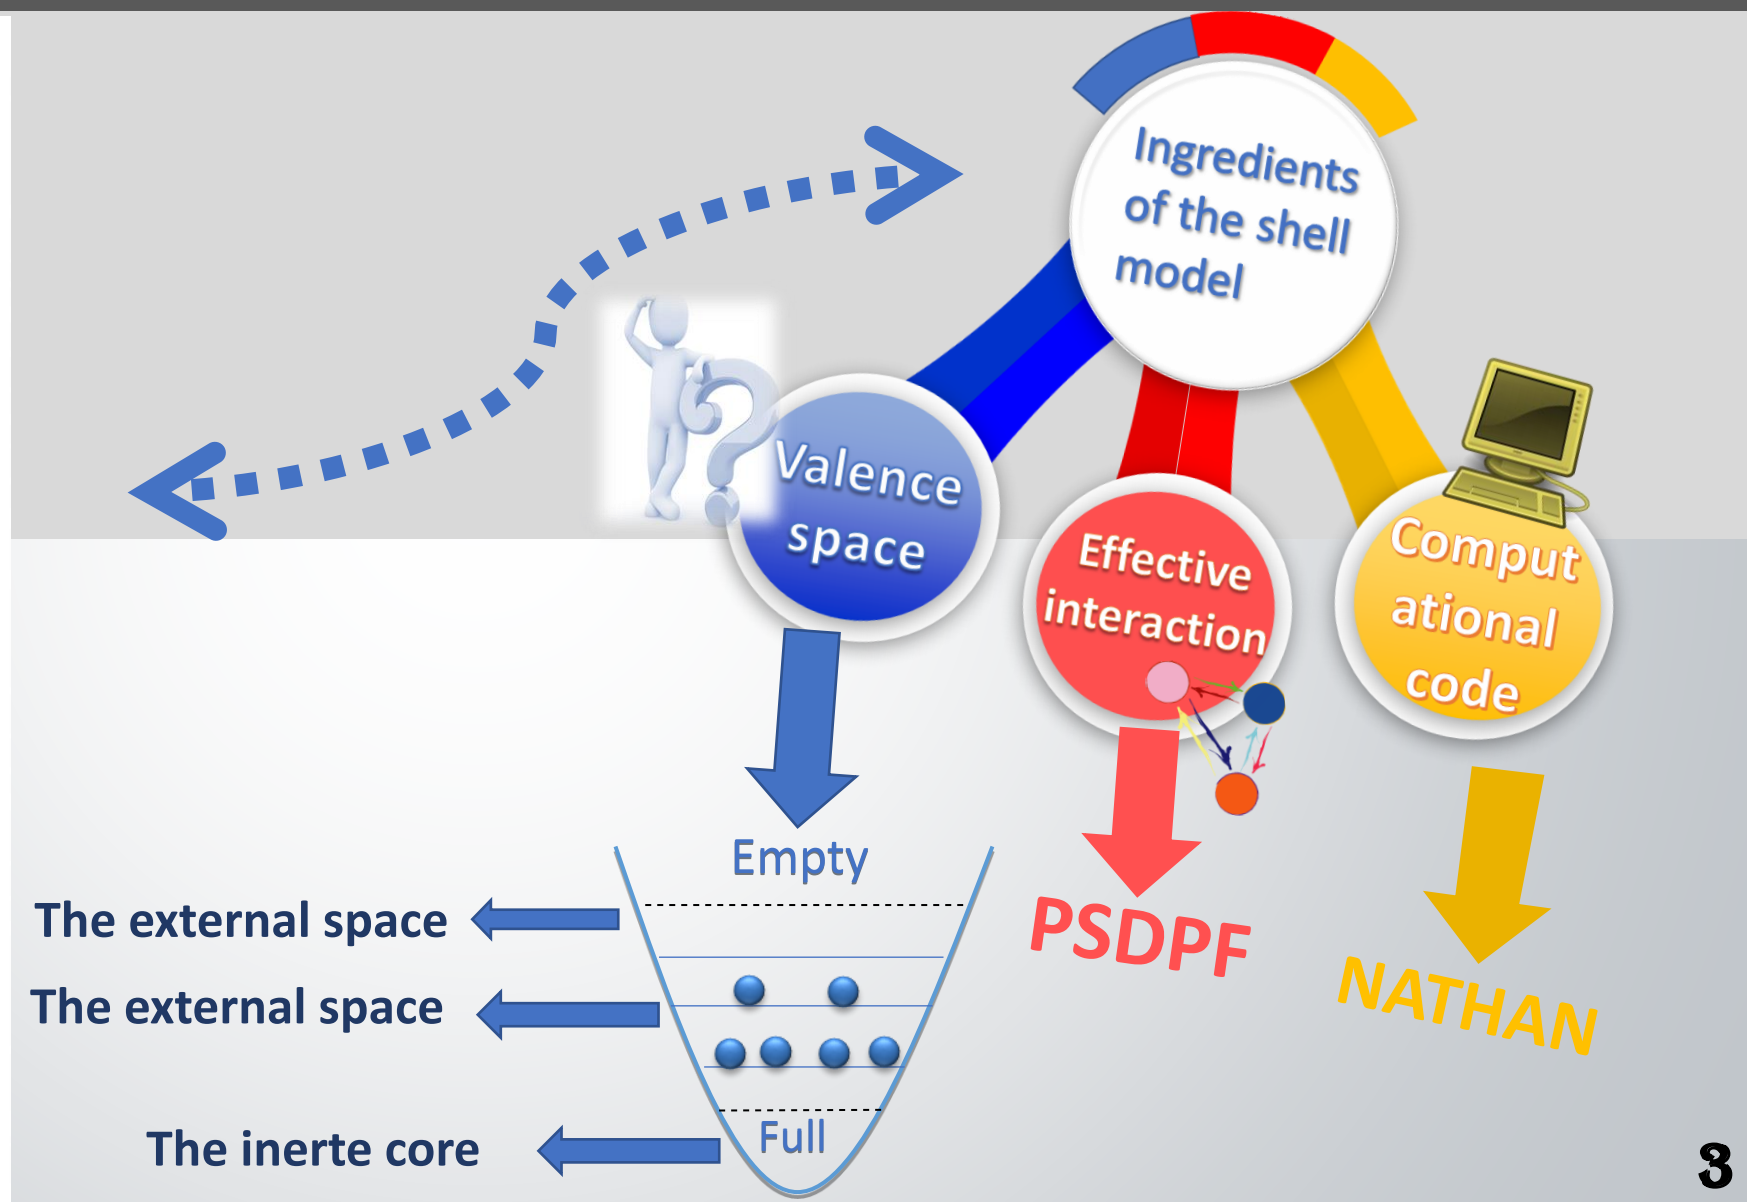

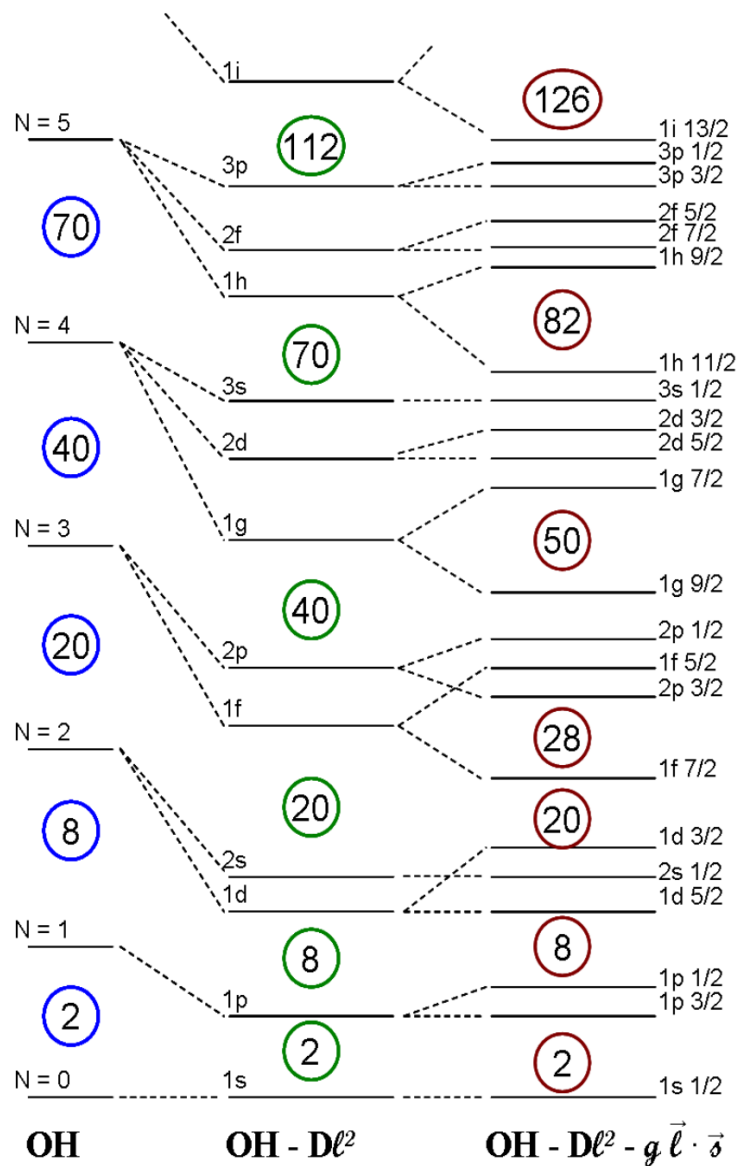

**XIV. International Conference on nuclear Structure Properties (NSP2021), Konya-Turkey**

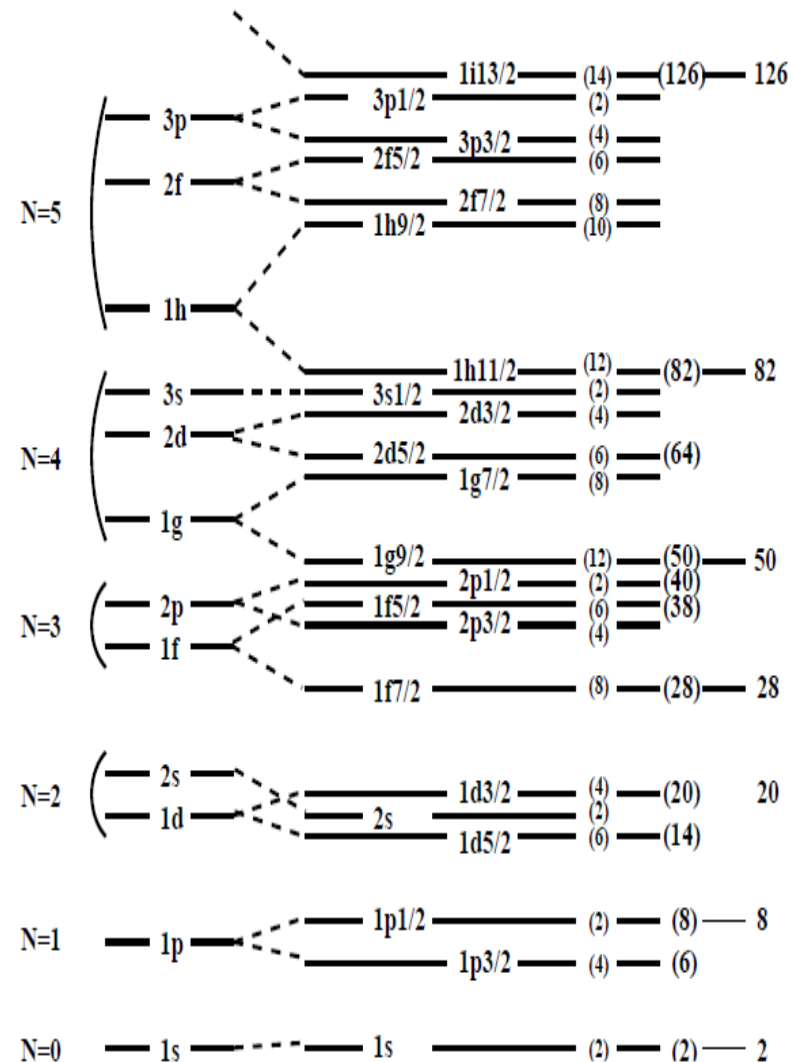

# Outline

- \* Nuclear shell model and sd-shell nuclei.**
- \* Importance of Silicon in astrophysics.**
- \* Spectroscopic properties of  $^{26}\text{Si}$ .**
- \*  $^{26}\text{Si}$  excitations of interest for the thermonuclear  $^{25}\text{Al}(p,\gamma)^{26}\text{Si}$  reaction.**
- \* Rate of reaction through a narrow resonance.**
- \* Conclusion.**

# Nuclear shell model and sd-shell nuclei

# Nuclear shell model and sd-shell nuclei

THE SD-SHELL NUCLEI ARE THOSE HAVING A NUMBER OF PROTONS (Z) AND NEUTRONS (N) BETWEEN 8 AND 20 (I.E NUCLEI FROM  $^{16}\text{O}$  TO  $^{40}\text{Ca}$ )

# Nuclear shell model and sd-shell nuclei

## USD (USDA/B)

## PSDPF

# Importance of Silicon in astrophysics

As it is the eighth most abundant element in the Universe, silicon has a significant astrophysical interest. This element plays a crucial role in the comprehension of nucleosynthesis, especially, the galactic chemical evolution, which begins when gravitational contraction raises the stars core temperature to 2.7-3.5(GK).

# Importance of Silicon in astrophysics

$*^{23}\text{Al}(p,\gamma)^{24}\text{Si} \rightarrow$  Type I x ray bursts.

$*^{25}\text{Al}(p,\gamma)^{26}\text{Si} \rightarrow$  Type I x ray bursts, Carbon-burning and Explosive neon-burning.

$*^{23}\text{Ne}(\alpha,p)^{26}\text{Mg} \rightarrow$  Explosive Ne/C burning (2.3 GK),  
Convective shell C/Ne burning (1.4 GK).

# Importance of Silicon in astrophysics

$^{26}\text{Al}(p,\gamma)^{27}\text{Si} \rightarrow \text{Hydrogen-burning.}$

$^{26}\text{Mg}(p,\gamma)^{27}\text{Al} \rightarrow \text{Hydrogen-burning (MgAl cycle).}$

$^{31}\text{P}(p,\gamma)^{28}\text{Si}$

$^{27}\text{Al}(p,\gamma)^{28}\text{Si}$

Hydrogen burning.

$^{25}\text{Al}(p,\gamma)^{26}\text{Si}$

# Spectroscopic properties of $^{26}\text{Si}$

- \* The structures of  $^{26}\text{Si}$  is not well known and it is experimentally difficult to reach because they have  $N < Z$ .
- \* We used its mirror nucleus  $^{26}\text{Mg}$  to determine the  $J^\pi$  assignments in the neutron deficient isotopes  $^{26}\text{Si}$ .
- \* We calculated, using the PSDPF interaction, its excitation energies from 0 to  $\sim 9$  Mev.

# $^{26}\text{Si}$ Excitations of interest for thermonuclear $^{25}\text{Al}(p,\gamma)^{26}\text{Si}$ reaction

- \* The  $^{25}\text{Al}(p,\gamma)^{26}\text{Si}$  reaction is important for our understanding of the  $^{26}\text{Si}$  abundance in massive stars.
- \* States in  $^{26}\text{Si}$  above the proton threshold energies ( $S_p = 5.514$  MeV), have an astrophysical interest and play a crucial role in the calculation of the  $^{25}\text{Al}(p,\gamma)$  reaction rate.
- \* We propose the  $J^\pi$  assignments of states of astrophysical interest as fellow.

# Rate of reaction through a narrow resonance

In this case, the resonance energy must be ‘near’ to the relevant energy range  $\Delta E$  to contribute to the stellar reaction rate.

The contribution of a single narrow resonance to the stellar reaction rate is given as:

$$N_A \langle \sigma v \rangle = 1.54 \times 10^{11} (\mu T_9)^{-3/2} (\omega \gamma) \exp\left(\frac{-E_r}{KT}\right) \text{ cm}^3 \text{ s}^{-1} \text{ mol}^{-1}$$

Here  $T_9$  is the temperature in GK,  $E_r = E_f - E_i$  is the resonance energy in the center of mass system, the resonance strength in MeV for proton capture is given by:

$$\omega \gamma_{if} = \frac{(2J_f + 1)}{(2J_p + 1)(2J_i + 1)} \frac{\Gamma_{pif} \Gamma_{\gamma f}}{\Gamma_{totalf}}$$

$\Gamma_{total} = \Gamma_{pif} + \Gamma_{\gamma f}$  is a total width of the resonance level and  $J_i$ ,  $J_p$  and  $J_f$  refer to the target, the proton projectile ( $J_p = 1/2$ ), and states in the final nucleus, respectively, which in turn depends mainly on the total and partial widths of the resonance, and the **reaction rate is determined by the smaller one of the widths.**

# Rate of reaction through a narrow resonance

$E_{\text{ex}}$ (MeV)	$J^\pi$	$\Gamma_p$ (eV)	$\Gamma_\gamma(\text{th})$ (eV)	$E_{\text{res}}$ (MeV)	$\omega\gamma(\text{th})$ (eV)

*Electromagnetic properties of states in  $^{26}\text{Si}$*

*Calculated  $^{25}\text{Al}(p,\gamma)^{26}\text{Si}$  astrophysical reaction rate*

# Conclusion

- $^{26}\text{Si}$  structure is of nuclear astrophysical interest, especially, its  $J^\pi$  assignments, Which play a crucial role in the calculation of the  $^{25}\text{Al}(p,\gamma)$  reaction.
- Experimentally, the  $^{26}\text{Si}$  spectrum is not so well known as the one of  $^{26}\text{Mg}$ .
- A comparison with the mirror nuclei  $^{26}\text{Mg}$  is important as well as with shell model using our  $(0+1) \hbar\omega$  PSDPF interaction.
- This study led us to confirm the uncertain states (states with uncertain  $J^\pi$ ) and to predict  $J^\pi$  assignments for the unidentified ones (states with unknown  $J^\pi$ ). The  $J^\pi$  assignments for states of astrophysical interest were also proposed.
- This rp-process reaction rate  $^{25}\text{Al}(p,\gamma)$  is crucial nuclear physics input to astrophysical models of nucleosynthesis in novae, supernovae and explosive hydrogen burning. We calculated it for  $^{26}\text{Si}$ .

THANK YOU!
